Graph Combinatorial Optimization

MIS — the largest possible group of nodes in a graph, where no two nodes are connected by an edge.

MVC — minimum — smallest possible group of nodes, such that every single edge in the entire graph is covered by at least one of the nodes in the group.

MC — max clique — largest possible group of nodes, where every single node is connected to every other node in that group. In other words, it forms a perfect, fully connected graph.

Each graph is a weighted graph.

a baseline model. 最基础，能包含流程的模型.
